3 Introduction

The following document details the Module Interface Specifications for the REVITALIZE app. The REVITALIZE app is an all-in-one health and wellness app, comprised of 1 main section and 3 major subsections. The main section is a calendar which organizes and documents the contents of the 3 subsections. The 3 subsections are the diet section, workout section, and sleep section.

Complementary documents include the System Requirement Specifications and Module Guide. The full documentation and implementation can be found at <https://github.com/BillNguyen1999/REVITALIZE/tree/main/docs>.

4 Notation

The structure of the MIS for modules comes from Hoffman and Strooper (1995), with the addition that template modules have been adapted from Ghezzi et al. (2003). The mathematical notation comes from Chapter 3 of Hoffman and Strooper (1995). For instance, the symbol $:=$ is used for a multiple assignment statement and conditional rules follow the form $(c_1 \Rightarrow r_1 | c_2 \Rightarrow r_2 | \dots | c_n \Rightarrow r_n)$.

The following table summarizes the primitive data types used by REVITALIZE.

Data Type	Notation	Description
character	char	a single symbol or digit
integer	\mathbb{Z}	a number without a fractional component in $(-\infty, \infty)$
natural number	\mathbb{N}	a number without a fractional component in $[1, \infty)$
real	\mathbb{R}	any number in $(-\infty, \infty)$
boolean	\mathbb{B}	value can be True (1) or False (0)
user	User	represents user object, for users of REVITALIZE
date	Date	represents date object, which is useful to add/set/manipulate dates

The specification of REVITALIZE uses some derived data types: sequences, strings, and tuples. Sequences are lists filled with elements of the same data type. Strings are sequences of characters. Tuples contain a list of values, potentially of different types. In addition, REVITALIZE uses functions, which are defined by the data types of their inputs and outputs. Local functions are described by giving their type signature followed by their specification.

5 Module Decomposition

The following table is taken directly from the Module Guide document for this project.

Level 1	Level 2
Hardware-Hiding	
	Input Parameters
	Output Format
	Output Verification
Behaviour-Hiding	Temperature ODEs
	Energy Equations
	Control Module
	Specification Parameters Module
Software Decision	Sequence Data Structure
	ODE Solver
	Plotting

Table 1: Module Hierarchy

6 MIS of Main Menu

6.1 Main Menu Module

6.2 Uses

react

react-native

globalStyles: CSS file to change designs of project

Ionicons: Library for icons

Moment: Library is used for Dates (ex. setting date formats (YY/MM/DD))

useRoute: react file that is used to navigate between screens of project

6.3 Syntax

6.3.1 Exported Constants

N/A

6.3.2 Exported Types

MainScreen = this

6.3.3 Exported Access Programs

Name	In	Out	Exceptions
displayDietScreen	User, Date		
displayExerciseScreen	User, Date		
displaySleepScreen	User, Date		
displayCalendarScreen			

6.4 Semantics

6.4.1 State Variables

user: User

date: Date

6.4.2 Environment Variables

dateText: Text object that displays the selected date.

dateButton: Button object that displays Calendar Screen when clicked.

forwardButton: Button object that displays the next day from current Date value in dateText when clicked

backwardButton: Button object that displays the previous day from current Date value in dateText when clicked

dietButton: Button object that displays Diet Screen when clicked

exerciseButton: Button object that displays Exercise Screen when clicked

sleepButton: Button object that displays Sleep Screen when clicked

6.4.3 Assumptions

N/A

6.4.4 Access Routine Semantics

displayDietScreen(user, date):

- transition: Navigates to Diet Screen when dietButton is pressed
- exception: None

displayExerciseScreen(user, date):

- transition: Navigates to Exercise Screen when exerciseButton is pressed
- exception: None

displaySleepScreen(user, date):

- transition: Navigates to Sleep Screen when sleepButton is pressed
- exception: None

displayCalendarScreen():

- transition: Navigates to Calendar Screen when dateButton is pressed
- exception: None

6.4.5 Local Functions

forwardSetDate():

- transition: `date.day.value := date.day.value + 1`. Sets the next day from the current Date value in `dateText` when clicked.
- exception: None

backwardSetDate():

- transition: `date.day.value := date.day.value - 1`. Sets the previous day from the current Date value in `dateText` when clicked.
- exception: None

7 MIS of Calendar

7.1 Calendar Module

7.2 Uses

react

react-native

globalStyles: CSS file to change designs of project

react-native-calendars: Library useful for implementing calendars in react-native

useRoute react file that is used to navigate between screens of project

7.3 Syntax

7.3.1 Exported Constants

N/A

7.3.2 Exported Types

CalendarScreen = this

7.3.3 Exported Access Programs

Name	In	Out	Exceptions
onDayPress			
onMonthChange			
onPressArrowLeft			
onPressArrowRight			

7.4 Semantics

7.4.1 State Variables

date: Date

7.4.2 Environment Variables

monthText: Text object that displays the selected month.

forwardMonthButton: Button object that displays the next month from current month value in monthText when clicked

backwardMonthButton: Button object that displays the previous month from current month value in monthText when clicked

7.4.3 Assumptions

N/A

7.4.4 Access Routine Semantics

onDayCalendar():

- transition: Changes date value to selected date value in CalendarScreen
- exception: None

onMonthChange():

- transition: Changes date.month.value to new date.month.value and monthText will be changed to string value of new date.month.value
- exception: None

onPressArrowRight():

- transition: $\text{date.month.value} := \text{date.month.value} + 1$. Sets the next date.month.value from the current date.month.value in monthText when clicked
- exception: None

onPressArrowLeft():

- transition: $\text{date.month.value} := \text{date.month.value} - 1$. Sets the previous date.month.value from the current date.month.value in monthText when clicked
- exception: None

7.4.5 Local Functions

N/A

8 MIS of Sleep

8.1 Container Module

8.2 Uses

react

react-native

react-native-reanimated

react-native-redash

Label: Module

Circular Slider: Module

8.3 Syntax

8.3.1 Exported Constants

PI := Math (object that provides mathematics functionality and constants)

TAU := 2 * PI

8.3.2 Exported Types

N/A

8.3.3 Exported Access Programs

Name	In	Out	Exceptions
DisplayContainer			

8.4 Semantics

8.4.1 State Variables

date: Date

8.4.2 Environment Variables

BedTime: string object that displays the selected bedtime.

WakeUpTime: string object that displays the selected wake up time.

SleepTime: string object that displays the total sleep time.

ArcStartPos: polar coordinates object representing starting position of circular slider arc.
Modifies BedTime and SleepTime when slid.

ArcEndPos: polar coordinates object representing ending position of circular slider arc.
Modifies WakeUpTime and SleepTime when slid.

CircularSliderArc: string literal object representing an arc.

8.4.3 Assumptions

N/A

8.4.4 Access Routine Semantics

DisplayContainer():

- output: display bedtime, wake up time, sleep time, arc starting and ending positions, and circular slider arc
- exception: None

8.4.5 Local Functions

radToMinutes(rad):

- output: $\text{rad} * 24 * 60 / \text{TAU}$
- exception: None

absoluteDuration(start, end):

- output: $\text{start} > \text{end} ? \text{end} + (\text{TAU} - \text{start}) : \text{end} - \text{start}$
- exception: None

formatDuration2(duration):

- output: total sleep time formatted in hours followed by minutes.
- exception: None

9 MIS of Sleep

9.1 Label Module

9.2 Uses

react

react-native

react-native-reanimated

react-native-redash

@expo/vector-icons

9.3 Syntax

9.3.1 Exported Constants

PI := Math (object that provides mathematics functionality and constants)

TAU := 2 * PI

9.3.2 Exported Types

N/A

9.3.3 Exported Access Programs

Name	In	Out	Exceptions
DisplayImage			
DisplayLabel	start, end		

9.4 Semantics

9.4.1 State Variables

start: the set bedtime is passed from Container module

end: the set wake up time is passed from Container module

9.4.2 Environment Variables

BedTime: string object that displays the selected bedtime.

WakeUpTime: string object that displays the selected wake up time.

9.4.3 Assumptions

N/A

9.4.4 Access Routine Semantics

DisplayImage():

- output: display bed icon, "BEDTIME" text, ring icon, and "WAKE UP" text
- exception: None

DisplayLabel(start, end):

- output: display user set BedTime and WakeUpTime
- exception: None

9.4.5 Local Functions

radToMinutes(rad):

- output: $\text{rad} * 24 * 60 / \text{TAU}$
- exception: None

formatDuration(duration):

- output: bed time and wake up time in the 24-hour clock format
- exception: None

10 MIS of Sleep

10.1 Circular Slider Module

10.2 Uses

react

react-native

react-native-reanimated

react-native-redash

react-native-svg

10.3 Syntax

10.3.1 Exported Constants

PI := Math (object that provides mathematics functionality and constants)

TAU := 2 * PI

10.3.2 Exported Types

N/A

10.3.3 Exported Access Programs

Name	In	Out	Exceptions
DisplayCircularSlider	ArcStartPos, ArcEndPos		

10.4 Semantics

10.4.1 State Variables

ArcStartPos: polar coordinates object, representing starting position of circular slider arc, is passed from Container module

ArcEndPos: polar coordinates object, representing ending position of circular slider arc, is passed from Container module

10.4.2 Environment Variables

ArcStartPos: Modifies BedTime and SleepTime when slid.

ArcEndPos: Modifies WakeUpTime and SleepTime when slid.

CircularSliderArc: string literal object representing an arc.

10.4.3 Assumptions

N/A

10.4.4 Access Routine Semantics

DisplayCircularSlider(start, end):

- output: display arc starting position, ending position, and circular slider arc
- exception: None

10.4.5 Local Functions

`absoluteDuration(start, end):`

- output: $\text{start} > \text{end} ? \text{end} + (\text{TAU} - \text{start}) : \text{end} - \text{start}$
- exception: None

`ConvertArcStartPos(ArcStartPos):`

- output: convert `ArcStartPos` from polar coordinates to canvas coordinates
- exception: None

`ConvertArcEndPos(ArcEndPos):`

- output: convert `ArcEndPos` from polar coordinates to canvas coordinates
- exception: None
